

First Press Release, Ljubljana, February 3, 2023

Jubilee 10th International Logistics Congress in Portorož!

The 10th most important event in the field of logistics in the Adria region, the **International Logistics Congress: "Supply Chains in Science and Practice 2023"**, will take place in **Portorož, Slovenia from April 5 to 7, 2023**. The Organizer of the congress, the [Slovenian Logistics Association](#), announces the congress with the **richest content ever**, supported by **many international and domestic lecturers and experts**, the **presentation of award-winning logistics projects**, and the **awarding of awards for life's work and the Logistitian of 2022**. The goal of the congress remains to **connect all stakeholders in the industry and in the region**, to **offer examples of good practices and knowledge** that congress participants can transfer to their activities. **The red thread** will again be **robotization and automation in logistics, production and transport**, with an important component of the comprehensive green transformation.

"Green transformation is much more than just changing energy sources."

From the very beginning, the Congress has successfully brought together all stakeholders who are in any way connected with logistics - from logistics, transport and manufacturing companies, providers of information and technological solutions, education and state authorities. This year, however, the greatest emphasis will be placed on "green transformation".

If green is associated with a smaller carbon footprint, **then green transformation is anything we do to create more with less energy consumption and as little use of other resources as possible**. Therefore, every increase in productivity, every optimization, be it related to work, material, paper... If we manage to combine all this into a successful story, we are talking about a comprehensive green transformation.

After all the challenges brought by the Covid epidemic, the geopolitical and economic situation in 2022 was strongly marked by the war in Ukraine. The prices of all energy products are significantly higher and unpredictable, which is also reflected in logistics costs. The lack of personnel, both in production and logistics, remains a major challenge. Green transformation, i.e. the search for opportunities in all areas, is more important this time than ever before.

Within the framework of the **10th jubilee international logistics congress "Supply chains in science and practice 2023"**, taking place in Slovenia, all creators will discuss topics from the fields of **comprehensive green transformation**, the role of connecting the **North Adriatic ports into the "NAPA" community**, **robotization and automation** in production and logistics, **good energy management practices** in companies and **optimization and digitization** in transport.

The event, which last year alone was attended by **330 participants from 10 European countries** and numerous **international lecturers and panelists**, is organized by the **Slovenian Logistics Association** in cooperation with the **Association for Transport at GZS and ACS**, the **Slovenian Automobile Cluster**.
